Recalibrated physical p: matched 4+3 and 4+4 noise comparison
Pre 4+3
Pre 4+4
STO+Marisa post 4+3
STO+Marisa post 4+4
Input fNL = +0
Input fNL = +0
Input fNL = +100
Input fNL = +100
Input fNL = -100
Input fNL = -100
median(f_{NL}) − f_{NL}^{input}
$\sigma(f_{NL})$ (posterior std)
k^B_{max} [h Mpc^{-1}]
Mean100 data; unaveraged C_single500; V=1; P0 k_max=.08; B000 two-leg cuts; no IR.
Fixed p; calibration uncertainty not propagated. Conditional diagnostics, not full STO-noise or k_max certification.

Complete numerical comparison - posterior standard deviations, not symmetric 68% errors

Physical p: pre=1.155156, post=1.308086; exactly one added R amplitude

Input	kB	Pre 4+3 median / std	Post 4+3 median / std	Pre 4+4 median / std	Post 4+4 median / std	Pre std8/std7	Post std8/std7
0	0.08	-4.15 / 95.62	9.60 / 85.25	-5.25 / 94.38	9.18 / 85.75	0.987	1.006

All 48 fits: four independent ensembles, 32 walkers; original convergence gates and full-chain replay verified.
Same targets, signal, full P-B covariance, fixed p and original seven priors between noise versions.
Pre C: fid1000-1499; post C: fid0-499. Fid target/post-C overlap and calibration-target overlap accepted.
Centered angular R has zero continuum monopole; its R=-10 to +10 lattice response is at most 0.0375 whitened units.
R remains near its uniform prior; this alone is not fNL prior sensitivity. Full parameter quantiles are in the JSON.
Old-p and older 12-parameter products are preserved separately; this table is not an independent mock-recovery claim.
